

1. LLM API Key for Process Automation

- An LLM API key is required to automate the data extraction process.
- It will also enhance our chatbot capabilities by enabling:
 - Search and retrieval of historical data.
 - Handling client-specific queries more effectively.
 - Interaction with our news database to provide relevant information.
- This will support additional automation initiatives planned for the near future.

2. Bitbucket Access

- Access to Bitbucket is required to maintain our codebase in a private repository. Currently, the code is hosted in a public GitHub repository.
- It will help us:
 - Automate cloud-based code execution and deployment processes.
 - GitHub Actions (It helps to Run the code in cloud automatically on scheduled time), which currently has a free-tier limit of 2,000 minutes per month. If we add more sources or scale the process then it will be challenging
 - Host and publish websites as required. (Currently Github provide free hosting service if we move to other platform it required hosting for our website)
- Required Database to store all the news data(All the source data). Currently, we rely on Supabase's free-tier database, which has a storage limitation of 500 MB.

3. Database Access

- Database access is required to automate data updates and maintenance.
- Currently, we follow a manual process:
 - Download data from ARMS.
 - Compare it with the daily extracted data.
 - Update records accordingly.
- This approach presents several challenges, including the need to manually download and synchronize ARMS data every day.
- Required access:
 - Permission to insert, update, and manage data directly within the database.
